

## Classes of Languages, Classes of Functions

Let  $C$  be any of our complexity classes, ie,  $AC^0$ ,  $TC^0$ ,  $NC^k$ ,  $AC^k$ ,  $L$ ,  $NL$ ,  $P$ ,  $NP$ , etc.

Let  $f$  be a function, s.t.,  $|f(x)| \leq |x|^{O(1)}$

Define:  $\{(x, i, b) : \text{the } i\text{th symbol of } f(x) \text{ is } b\}$

Note the function  $f$  is “computable in  $C$ ” in the usual, intuitive sense if and only if the set  $\{(x, i, b) : \text{the } i\text{th symbol of } f(x) \text{ is } b\} \in C$

Actually, when  $C = NP$ , it is not so clear that this is the “usual, intuitive sense”. The class of functions for which  $\{(x, i, b) : \text{the } i\text{th symbol of } f(x) \text{ is } b\}$  is in  $NP$  is sometimes called  $SVNP$ . Alternatively, we define  $\{f : \exists NP \text{ machine } M, \text{ s.t., on input } x, \text{ there is some accepting path of } M \text{ on } x, \text{ and all accepting paths output } f(x)\}$ .

There are some other important classes of functions related to  $NP$  in some natural “intuitive” senses:

Classes of functions related to  $NP$ :

- $FP^{NP}$ : the class of functions computable in polynomial time with an “oracle” for  $NP$
- $\#P$ :  $\{f : \Sigma^* \rightarrow N, \text{ where } \exists \text{ an } NP \text{ machine } M, \text{ s.t., } f(x) = \#acc_M(x), \text{ where } \#acc_M(x) \text{ is defined to be the number of accepting computations of } M \text{ on input } x.\}$
- $\{f : \exists \text{ a predicate } R \text{ in } P, \text{ s.t., } f(x) = Max_{y \in \{0,1\}^{|x|^k}} (R(x, y))\}$   
This class of functions is called  $OptP$ .

Last time we introduced  $\leq_m^C$  reducibility.

This is the most useful notion of reducibility, but it isn’t the most general notion. Sometimes, the more general notions are important.

- $\leq_T^C$ , (Turing reducibility) captures the notion of having a free “subroutine”, which is also called an “Oracle”.

- Oracle Turing Machines have an additional “oracle tape”, which alternates between write-only and read-only states. Associated with any oracle machine is a particular problem  $Y$  which the oracle can solve for free. While the oracle tape is in write-only state, the TM can at any time enter a query  $y$ , ie, write the query string on the oracle tape. At the next step the contents  $y$  of the oracle tape will be replaced by a string  $b$  such that  $(y, b) \in Y$ , and the tape will become read-only.

Claim: Multiplication is “not harder than” MAJORITY. See Figure 1

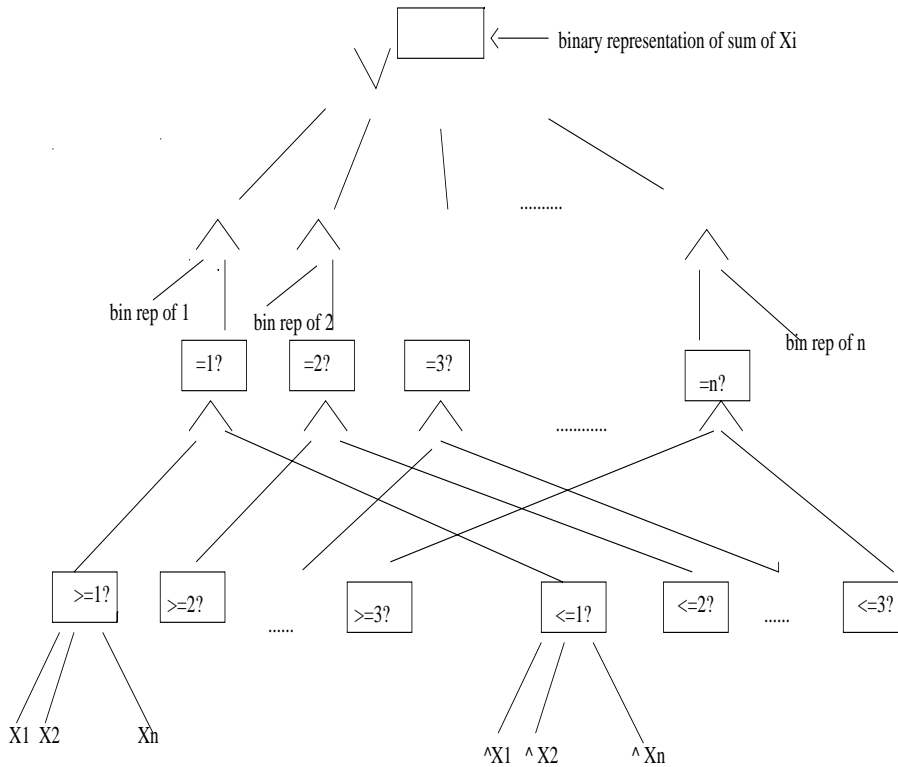

Figure 1: Adding n bits can be done in  $TC^0$

Therefore we get:

$$\begin{aligned} \text{MULTIPLICATION} &\in TC^0 \\ \text{MULTIPLICATION} &\leq_T^{AC^0} \text{MAJORITY} \end{aligned}$$

More precisely, in a circuit-based model, we say  $A \leq_T^C B$  if we can build “ $C$ -circuit” for  $A$  using  $B$ -gates.

Conversely,  $\text{MAJORITY} \leq_T^{AC^0} \text{MULTIPLICATION}$ . See Figure 2

$$\begin{array}{r}
 X1\ 000\dots 0X2000\dots 0X3000\dots 0\dots\dots\dots 000Xn \\
 * \quad 1\ 000\dots 01\ 0000\dots 01\ 0000\dots 0\dots\dots\dots 1\dots 001 \\
 \hline
 \begin{array}{r}
 X1\ 000\dots 0X2000\dots 0X3000\dots 0\dots\dots\dots 000Xn \\
 X1000\dots 0X2\ 000\dots 0X3000\dots 0\dots\dots\dots 000Xn \\
 \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots \\
 \dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots\dots \\
 + \quad X1000\dots 0X2000\dots 0X3000\dots 0\dots\dots\dots 000Xn
 \end{array} \\
 \hline
 \text{Sum of } X_i \geq n/2?
 \end{array}$$

Figure 2:  $\text{MAJORITY} \leq_T^{AC^0} \text{MULTIPLICATION}$

$\text{MULTIPLICATION} \equiv_T^{AC^0} \text{MAJORITY} \equiv_T^{AC^0} \text{SORTING} \equiv_T^{AC^0}$   
 All of these problems are complete for  $TC^0$  under  $\leq_T^{AC^0}$  reducibility.  
 Fact: Most experts believe  $TC^0$  has no complete set under  $\equiv_{\text{Many-one}}^{AC^0}$  reducibility.
