1

## Modes of communication

- **One-to-One**
  - Unicast
    - 1↔1
    - Point-to-point
  - Anycast
    - 1→nearest 1 of several identical nodes
    - Introduced with IPv6; used with BGP routing protocol
- **One-to-many**
  - Multicast
    - 1→many
    - **group communication**
  - Broadcast
    - 1→all

October 6, 2018

© 2014-2018 Paul Krzyzanowski

2

## Groups

Groups allow us to deal with a collection of processes as one abstraction

### Send message to one entity

- Deliver to entire group

### Groups are *dynamic*

- Created and destroyed
- Processes can join or leave
  - May belong to 0 or more groups

### Primitives

*join\_group, leave\_group, send\_to\_group, query\_membership (sometimes)*

October 6, 2018

© 2014-2018 Paul Krzyzanowski

3

## Design Issues

- **Closed vs. Open**
  - Closed: only group members can send messages
- **Peer vs. Hierarchical**
  - Peer: each member communicates with the entire group
  - Hierarchical: go through coordinator(s)
    - **Root coordinator**: forwards message to appropriate subgroup coordinators
- **Managing membership & group creation/deletion**
  - Distributed vs. centralized
- **Leaving & joining must be synchronous**
- **Fault tolerance**
  - Reliable message delivery? What about missing members?

October 6, 2018

© 2014-2018 Paul Krzyzanowski

4

## Failure considerations

The same things bite us with unicast communication

- **Crash failure**
  - Process stops communicating
- **Omission failure** (typically due to network)
  - Send omission: A process fails to send messages
  - Receive omission: A process fails to receive messages
- **Byzantine failure**
  - Some messages are faulty
- **Partition failure**
  - The network may get segmented, dividing the group into two or more unreachable sub-groups

5

## Implementing Group Communication Mechanisms

October 6, 2018

© 2014-2018 Paul Krzyzanowski

6

### Hardware multicast

If we have hardware support for multicast

- Group members listen on network address

October 6, 2018 © 2014-2018 Paul Krzyzanowski 7

### Broadcast

Diffusion group: send to all clients & then filter

- Software filters incoming multicast address
- May use auxiliary address (not in the network address header) to identify group

October 6, 2018 © 2014-2018 Paul Krzyzanowski 8

### Hardware multicast & broadcast

- Ethernet supports both multicast & broadcast
- Limited to local area networks

October 6, 2018 © 2014-2018 Paul Krzyzanowski 9

### Software implementation: multiple unicasts

Sender knows group members

October 6, 2018 © 2014-2018 Paul Krzyzanowski 10

### Software implementation: hierarchical

Multiple unicasts via group coordinator

- Coordinator knows group members
- Coordinator iterates through group members
- May support a hierarchy of coordinators

October 6, 2018 © 2014-2018 Paul Krzyzanowski 11

### Reliability of multicasts

October 6, 2018 © 2014-2018 Paul Krzyzanowski 12

## Atomic multicast

### Atomicity

Message sent to a group arrives at *all* group members

- If it fails to arrive at *any* member, no member will process it

### Problems

- Unreliable network
- Each message should be acknowledged
- Acknowledgements can be lost

Message sender might die

October 6, 2018 © 2014-2018 Paul Krzyzanowski 13

## Achieving atomicity

- General idea**
  - Ensure that *every* recipient acknowledges receipt of the message
  - Only then allow the application to process the message
  - If we give up on a recipient then *no recipient* can process that received message
- Easier said than done!**
  - What if a recipient dies after acknowledging the message?
    - Is it obligated to restart?
    - If it restarts, will it know to process the message?
  - What if the sender (or coordinator) dies partway through the protocol?

October 6, 2018 © 2014-2018 Paul Krzyzanowski 14

## Achieving atomicity – example 1

### Retry through network failures & system downtime

- Sender & receivers maintain a **persistent log**
- Each message has a unique ID so we can discard duplicates
- Sender
  - Send message to all group members
  - Write message to log
  - Wait for acknowledgement from each group member
  - Write acknowledgement to log
  - If timeout on waiting for an acknowledgement, retransmit to group member
- Receiver
  - Log received non-duplicate message to persistent log
  - Send acknowledgement
- NEVER GIVE UP!**
  - Assume that dead senders or receivers will be rebooted and will restart where they left off

October 6, 2018 © 2014-2018 Paul Krzyzanowski 15

## Achieving atomicity – example 2

### Redefine the group

- If some members failed to receive the message:
  - Remove the failed members from the group
  - Then allow existing members to process the message
- But still need to account for the death of the sender
  - Surviving group members may need to take over to ensure all current group members receive the message
- This is the approach used in virtual synchrony

October 6, 2018 © 2014-2018 Paul Krzyzanowski 16

## Reliable multicast

- All non-faulty group members will receive the message
  - Assume sender & recipients will remain alive
  - Network may have glitches
    - Try to retransmit undelivered messages ... but eventually give up
  - It's OK if some group members don't get the message
- Acknowledgements**
  - Send message to each group member
  - Wait for acknowledgement from each group member
  - Retransmit to non-responding members
  - Subject to **feedback implosion**

October 6, 2018 © 2014-2018 Paul Krzyzanowski 17

## Optimizing Acknowledgements

- Easiest thing is to wait for an ACK before sending the next message
  - But that incurs a round-trip delay
- Optimizations
  - Pipelining**
    - Send multiple messages – receive ACKs asynchronously
    - Set timeout – retransmit message for missing ACKs
  - Cumulative ACKs**
    - Wait a little while before sending an ACK
    - If you receive others, then send one ACK for everything
  - Piggybacked ACKs**
    - Send an ACK along with a return message
  - Negative ACKs**
    - Use a sequence # on each message
    - Receiver requests retransmission of a missed message
    - More efficient but requires sender to buffer messages indefinitely
- TCP does the first three of these ... but now we have to do this for each recipient

October 6, 2018 © 2014-2018 Paul Krzyzanowski 18

### Unreliable multicast (best effort)

- Basic multicast
- Hope it gets there

October 6, 2018 © 2014-2018 Paul Krzyzanowski 19

### Message ordering

October 6, 2018 © 2014-2018 Paul Krzyzanowski 20

### Good Ordering

order received

October 6, 2018 © 2014-2018 Paul Krzyzanowski 21

### Bad Ordering

order received

October 6, 2018 © 2014-2018 Paul Krzyzanowski 22

### Good Ordering

order received

Process 0

Process 1

October 6, 2018 © 2014-2018 Paul Krzyzanowski 23

### Bad Ordering

order received

Process 0

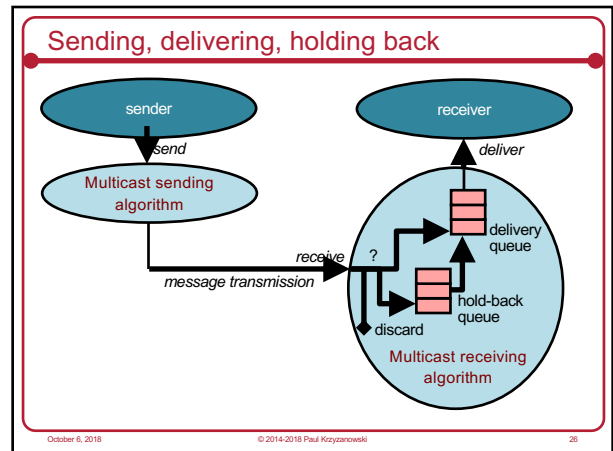

Process 1

October 6, 2018 © 2014-2018 Paul Krzyzanowski 24

### Sending vs. Receiving vs. Delivering

- Multicast receiver algorithm decides when to *deliver* a message to the process.
- A received message may be:
  - **Delivered immediately**  
(put on a delivery queue that the process reads)
  - **Placed on a hold-back queue**  
(because we need to wait for an earlier message)
  - **Rejected/discarded**  
(duplicate or earlier message that we no longer want)

October 6, 2018 © 2014-2018 Paul Krzyzanowski 25

### Global time ordering

- All messages are delivered in exact order sent
- Assumes two events never happen at the exact same time!
- Difficult (impossible) to achieve
- Not viable

October 6, 2018 © 2014-2018 Paul Krzyzanowski 27

### Total ordering

- Consistent ordering at all receivers
- All messages are delivered at all group members in the same order
  - They are sorted in the same order in the delivery queue

1. If a process sends  $m$  before  $m'$  then any other process that delivers  $m'$  will have delivered  $m$ .
2. If a process delivers  $m'$  before  $m''$  then every other process will have delivered  $m'$  before  $m''$ .

- Implementation:
  - Attach unique totally sequenced message ID
  - Receiver delivers a message to the application only if it has received all messages with a smaller ID

October 6, 2018 © 2014-2018 Paul Krzyzanowski 28

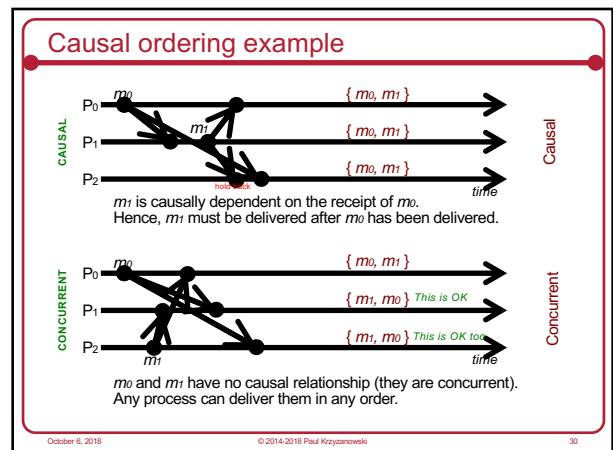

### Causal ordering

- Also known as **partial ordering**
  - Messages sequenced by Lamport or Vector timestamps

If  $\text{multicast}(G, m) \rightarrow \text{multicast}(G, m')$   
then every process that delivers  $m'$  will have delivered  $m$

- If message  $m'$  is causally dependent on message  $m$ , all processes must deliver  $m$  before  $m'$ .

October 6, 2018 © 2014-2018 Paul Krzyzanowski 29

### Causal ordering – implementation

Implementation:  $P_a$  receives a message from  $P_b$

- Each process keeps a **precedence vector** (similar to vector timestamp)
- Vector is updated on multicast **send** and **receive** events
  - Each entry = # of latest message from the corresponding group member that causally precedes the event

October 6, 2018 © 2014-2018 Paul Krzyzanowski 32

### Causal ordering – implementation

Algorithm

- When  $P_b$  **sends** a message, it increments its own entry and sends the vector
  - $V_b[b] = V_b[b] + 1$
  - Send  $V_b$  with the message
- When  $P_a$  **receives** a message from  $P_b$ 
  - Check that the message arrived in FIFO order from  $P_b$ :
    - $V_b[b] == V_a[b] + 1$  ?
  - Check that the message does not causally depend on something  $P_a$  has not seen:
    - $\forall i, i \neq b: V_b[i] \leq V_a[i]$  ?
  - If both conditions are satisfied,  $P_a$  will deliver the message
    - At  $P_a$ , update  $V_a[b] = V_b[b] + 1$
  - Otherwise, **hold the message** until the conditions are satisfied

October 6, 2018 © 2014-2018 Paul Krzyzanowski 33

### Causal Ordering: Example

$P_2$  receives message  $m_1$  from  $P_1$  with  $V_1=(1,1,0)$

(1) Is this in FIFO order from  $P_1$ ?

Compare current  $V$  on  $P_2$ :  $V_2=(0,0,0)$  with received  $V$  from  $P_1$ ,  $V_1=(1,1,0)$   
 Yes:  $V_2[1] = 0$ , received  $V_1[1] = 1 \Rightarrow$  sequential order

(2) Is  $V_1[i] \leq V_2[i]$  for all other  $i$ ?

Compare the same vectors:  $V_2=(0,0,0)$  vs.  $V_1=(1,1,0)$   
 No. ( $V_1[0] = 1$ ) > ( $V_2[0] = 0$ )  
 Therefore: **hold back  $m_1$**  at  $P_2$

October 6, 2018 © 2014-2018 Paul Krzyzanowski 34

### Causal Ordering: Example

$P_2$  receives message  $m_0$  from  $P_0$  with  $V=(1,0,0)$

(1) Is this in FIFO order from  $P_0$ ?

Compare current  $V$  on  $P_2$ :  $V_2=(0,0,0)$  with received  $V$  from  $P_0$ ,  $V_0=(1,0,0)$   
 Yes:  $V_2[0] = 0$ , received  $V_0[0] = 1 \Rightarrow$  sequential

(2) Is  $V_0[i] \leq V_2[i]$  for all other  $i$ ?

Yes. ( $0 \leq 0$ ), ( $0 \leq 0$ ).

**Deliver  $m_0$ . Update precedence vector from  $(0, 0, 0)$  to  $(1, 0, 0)$**   
 Now check hold-back queue. Can we deliver  $m_1$ ?

October 6, 2018 © 2014-2018 Paul Krzyzanowski 35

### Causal Ordering: Example

(1) Is the held-back message  $m_1$  in FIFO order from  $P_0$ ?

Compare current  $V$  on  $P_2$ :  $V_2=(1,0,0)$  with held-back  $V$  from  $P_0$ ,  $V_0=(1,1,0)$   
 Yes: (current  $V_2[1] = 0$ ) vs. (received  $V_0[1] = 1$ )  $\Rightarrow$  **sequential**

(2) Is  $V_0[i] \leq V_2[i]$  for all other  $i$ ?

Now yes. ( $V_0[0] = 1$ )  $\leq$  ( $V_2[0] = 1$ ) and element 2: ( $V_0[2] = 0$ )  $\leq$  ( $V_2[2] = 0$ )

**Deliver  $m_1$ .**

Causal ordering can be implemented more efficiently than total ordering:  
 No need for a global sequencer.  
 Expect reliable delivery but we may not need to send immediate acknowledgements.

October 6, 2018 © 2014-2018 Paul Krzyzanowski 36

### Sync ordering

- Messages can arrive in any order
- Special message type
  - Synchronization primitive**
  - Ensure all pending messages are delivered before any additional (post-sync) messages are accepted

If  $m'$  is sent with a sync-ordered primitive and  $m'$  is multicast, then every process either delivers  $m$  before  $m'$  or delivers  $m$  before  $m$ .

Multiple sync-ordered primitives from the same process must be delivered in order.

October 6, 2018 © 2014-2018 Paul Krzyzanowski 37

### Single Source FIFO (SSF) ordering

- Messages from the same source are delivered in the order they were sent.
- Message  $m$  must be delivered before message  $m'$  iff  $m$  was sent before  $m'$  from the same host.

If a process issues a multicast of  $m$  followed by  $m'$ , then every process that delivers  $m'$  will have already delivered  $m$ .

38

### Single Source FIFO (SSF) ordering

If a process issues a multicast of  $m$  followed by  $m'$ , then every process that delivers  $m'$  will have already delivered  $m$ .

39

### Unordered multicast

- Messages can be delivered in different order to different members
- Order per-source does not matter.

40

### Multicasting considerations

41

### IP multicast routing

42

### IP multicast routing

- Deliver messages to a subset of nodes
  - Send to a **multicast address**
- How do we identify the recipients?
  - Enumerate them in the header?
    - What if we don't know?
    - What if we have thousands of recipients?
- Use a **special address** to identify a group of receivers
  - A copy of the packet is delivered to all receivers associated with that group
  - **IPv4: Class D multicast IP address**
    - 32-bit address that starts with 1110 (224.0.0.0/4 = 224.0.0.0 – 239.255.255.255)
  - **IPv6: 128-bit address with high-order bits 8 bits all 1**
  - **Host group** = set of machines listening to a particular multicast address
    - A copy of the message is delivered to all receivers associated with that group

43

### IP multicasting

- Can span multiple physical networks
- Dynamic membership
  - Machine can join or leave at any time
- No restriction on number of hosts in a group
- Machine does not need to be a member to send messages
- Efficient: Packets are replicated only when necessary
- Like IP, no delivery guarantees

October 6, 2018 © 2014-2018 Paul Krzyzanowski 44

### IP multicast addresses

- Addresses chosen arbitrarily for an application
- Well-known addresses assigned by IANA

**Internet Assigned Numbers Authority**  
 IPv4 addresses: <http://www.iana.org/assignments/multicast-addresses/multicast-addresses.xml>  
 IPv6 addresses: <https://www.iana.org/assignments/ipv6-multicast-addresses/ipv6-multicast-addresses.xhtml>

- Similar to ports – service-based allocation
  - For ports, we have:
    - FTP: port 21, SMTP: port 25, HTTP: port 80
  - For multicast, we have:
 

224.0.0.1:	all systems on this subnet
224.0.0.2:	all multicast routers on subnet
224.0.23.173:	Philips Health
224.0.23.52:	Amex Market Data
224.0.12.0-63:	Microsoft & MSNBC
FF02:0:0:0:0:0:9:	RIP routers

October 6, 2018 © 2014-2018 Paul Krzyzanowski 45

### IGMP

- **Internet Group Management Protocol (IGMP)**
  - Operates between a host and its attached router
  - Goal: *allow a router to determine to which of its networks to forward IP multicast traffic*
  - IP protocol (IP protocol number 2)
- Three message types
  - **Membership\_query**
    - Sent by a router to all hosts on an interface to determine the set of all multicast groups that have been joined by the hosts on that interface
  - **Membership\_report**
    - Host response to a query or an initial join or a group
  - **Leave\_group**
    - Host indicates that it is no longer interested
    - Optional: router infers this if the host does not respond to a query

October 6, 2018 © 2014-2018 Paul Krzyzanowski 46

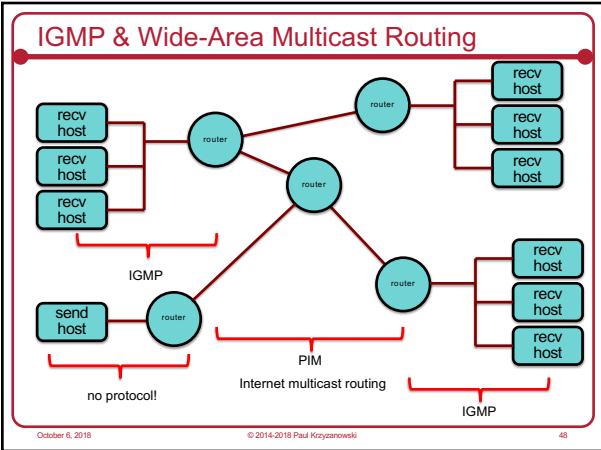

### Multicast Forwarding

IGMP allows a host to *subscribe* to *receive* a multicast stream

What about the source?

- There is no protocol for the source!
- It just sends one message to a class D address
- Routers have to do the work

October 6, 2018 © 2014-2018 Paul Krzyzanowski 47

### Multicast Forwarding

- **IGMP: Internet Group Management Protocol**
  - Designed for routers to talk with hosts on directly connected networks
- **PIM: Protocol Independent Multicast**
  - Multicast Routing Protocol for delivering packets across routers
  - Topology discovery is handled by other protocols
  - Two forms:
    1. Dense Mode (PIM-DM)
    2. Sparse Mode (PIM-SM)

October 6, 2018 © 2014-2018 Paul Krzyzanowski 49

### Flooding: Dense Mode Multicast (PIM-DM)

- Relay multicast packet to all connected routers
  - Use a spanning tree and **reverse path forwarding (RPF)** to avoid loops
  - Feedback & cut off if there are no interested receivers on a link
    - A router sends a **prune** message.
    - Periodically, routers send messages to refresh the prune state
  - **Flooding is initiated by the sender's router**
- **Reverse path forwarding (RPF):** avoid routing loops
  - Packet is duplicated & forwarded **ONLY IF** it was received via the link that is the shortest path to the sender
  - Shortest path is found by checking the router's forwarding table to the source address

October 6, 2018

© 2014-2018 Paul Krzyzanowski

50

### Flooding: Dense Mode Multicast

- **Advantage:**
  - Simple
  - Good if the packet is desired in most locations
- **Disadvantage:**
  - wasteful on the network, wasteful extra state & packet duplication on routers

October 6, 2018

© 2014-2018 Paul Krzyzanowski

51

### Sparse Mode Multicast (PIM-SM)

- Initiated by the routers at each receiver
- Each router needs to ask for a multicast feed with a PIM **Join** message
  - Initiated by a router at the destination that gets an IGMP *join*
  - Rendezvous Point: meeting place between receivers & source
    - **Join** messages propagate to a defined **rendezvous point (RP)**
    - Sender transmits only to the rendezvous point
    - RP announcement messages inform edge routes of rendezvous points
  - A **Prune** message stops a feed
- **Advantage**
  - Packets go only where needed
  - Creates extra state in routers only where needed

October 6, 2018

© 2014-2018 Paul Krzyzanowski

52

### IP Multicast in use

- **Initially exciting:**
  - Internet radio, NASA shuttle missions, collaborative gaming
- **But:**
  - Few ISPs enabled it
  - For the user, required tapping into existing streams (not good for on-demand content)
  - Industry embraced unicast instead

October 6, 2018

© 2014-2018 Paul Krzyzanowski

53

### IP Multicast in use: IPTV

- IPTV has emerged as the biggest user of IP multicast
  - Cable TV networks have migrated (or are migrating) to IP delivery
- Cable TV systems: aggregate bandwidth ~ 4.5 Gbps
  - Video streams: MPEG-2 or MPEG-4 (H.264)
  - MPEG-2 HD: ~30 Mbps ⇒ 150 channels = ~4.5 Gbps
  - MPEG-4 HD: ~6-9 Mbps; DVD quality: ~2 Mbps
- **Multicast**
  - Reduces the number of servers needed
  - Reduces the number of duplicate network streams

October 6, 2018

© 2014-2018 Paul Krzyzanowski

54

### IP Multicast in use: IPTV

- Multicast allows one stream of data to be sent to multiple subscribers using a single address
- IGMP from the client
  - Subscribe to a TV channel
  - Change channels
- Use unicast for video on demand

October 6, 2018

© 2014-2018 Paul Krzyzanowski

55
